

# FMCG Summary

## Key Findings

1. Total revenue across the full dataset stands at N214.37M, generated from approximately 4,000 orders.
2. Overall Gross Profit % is 0.35 (35%), indicating a healthy blended margin across all product categories and regions.
3. Lagos (N44.67M) and Abuja (N44.10M) are the top two regions by revenue, closely followed by Ibadan (N44.19M) and Kano (N43.68M). The four leading regions are tightly clustered within roughly N1M of each other, indicating a fairly even regional spread and not one dominant hub.
4. Across the full product table, total `Gross_Profit_Pct` is 0.35, with Bullet Energy 250ml, Grand Malt 330ml, and Power Horse 250ml each posting the strongest margin at 0.39 (shown in green), while Chivita 100% Orange 1L lags at 0.30 (shown in red) despite being a top revenue earner (a classic 'high volume, lower margin' product profile).
5. Power Horse 250ml leads in `Units_Sold` (31,124 units) by a wide margin over the next-closest product (Bullet Energy 250ml at 15,836), making it the clear volume driver even though Chivita generates slightly more total revenue.

## Methodology Decisions:

1. `Total_Revenue`, `Total_Order`, `Gross_Profit_Pct`, `YoY_Growth_Pct`, and `Target_Achievement_Pct` were built as standalone DAX measures, so they recalculate correctly under any filter/slicer context applied on this page.
2. Region and Category slicers were placed on this page to let the dashboard reviewer interact with KPIs.
3. Customer-level scatter plot uses `Customer_Name` on the Legend field so that each customer gives one bubble, with `Total_Revenue/Total_Order` on X/Y-axis.
4. The `Region/Product_Name` matrix and decomposition tree both pull from the same underlying Sales fact table joined to Region and Product dimension tables, keeping channel-level (Distributor/Wholesaler/Retailer/Supermarket/Pharmacy) subtotals consistent across visuals.
5. Conditional formatting on `Gross_Profit_Pct` uses rule-based thresholds (red/orange/green) rather than a continuous color scale, so that reviewers can read a clear pass/fail margin signal per product rather than a gradient that's harder to interpret at a glance.

## Limitations:

1. `Target_Achievement_Pct` of 19% is reported as a single blended figure on this page. However, the root cause (specific regions, months, or reps driving the shortfall) is not visible here and requires drill-down on later pages.
2. The Year/Quarter filter pane was unfiltered in the reviewed view, so this summary reflects the full 2022–2024 dataset and not any single period.
